

Workplace Performance Dashboard

From Space to Insights — Optimizing Workplace Efficiency

This dashboard combines spatial data, occupancy, and operational metrics to provide a clear view of how our workplace is used and where improvements can be made. It helps the management team make data-driven decisions for better space utilization, employee experience, and operational efficiency.

Occupancy Status

- High (>80%)
- Medium (50-80%)
- Low (<50%)

Overall Occupancy

1. Line Chart – Space Utilization Trend

Average occupancy rate across all spaces

2. Stacked Bar Chart – Department Space Distribution

Total area (m²) by department

3. Donut Chart – Space Type Distribution

Percentage of total spaces

4. Area Chart – Occupancy by Space Type

Trend of average occupancy rate

5. Histogram – Employee Age Distribution

Number of employees

6. Funnel Chart – Space Booking Process

From request to confirmed booking

7. Heatmap – Space Utilization by Time & Day

Shows peak usage patterns

8. Radar Chart – Department Performance

Based on key operational metrics

9. Choropleth Map – City Performance

Average occupancy rate across supported cities

City Performance Summary

City	Occupancy Rate
1 London	76%
2 Madrid	68%
3 Paris	74%
4 Munich	70%
5 Amsterdam	72%
6 Rome	62%
7 Lisbon	63%
8 Vienna	66%
9 Brussels	69%

Key Insights

- Workspaces have the highest utilization rate at 82%.
- Meeting rooms show peak usage on Tuesdays and Thursdays.
- London and Paris have the highest occupancy rates among all cities.
- There is potential to improve utilization in break areas (46%) and some executive offices (58%).

Better Spaces. Higher Performance.

Data-driven insights help us create more efficient, flexible, and people-focused workplaces across all locations — from Dubai to Europe.

1. Floor Plans with Live Data Overlays

Real-time insights on space utilization, occupancy and department distribution.

Live Space Overview

Department Distribution

2. Line Chart

Occupancy trend over time.

3. Stacked Bar Chart

Space usage by department.

4. Donut Chart

Employee distribution by department.

5. Area Chart

Workspace utilization by area type.

6. Histogram

Employee age distribution.

7. Funnel Chart

Recruitment pipeline.

8. Heatmap

Department activity by day and time.

9. Radar Chart

Performance comparison by department.

10. Treemap Chart

Space allocation by function.

Key Insights

Workspaces are the highest utilized areas (85%).

Meeting rooms show strong demand (72%).

IT facilities are underutilized (38%) – opportunity for optimization.

London has the highest activity across all locations.

Better Spaces. Greater Impact.

POS Project

Architecture, Spatial Analysis & Data-Driven Decision Making

Project Type
Office / Workplace
Interior Design

Location
Mall

Role
Architect

Scope
Architecture +
Interior Design

BETTER
SPACES
FOR A MORE
EFFICIENT
TOMORROW

1. Project Overview

The POS project at Mall involved the development of an office and workplace environment with a variety of functional spaces designed to support different organizational activities. The project included executive offices, meeting and training spaces, administrative departments, operational support areas, employee workspaces, IT facilities, service areas, and employee wellbeing spaces.

The architectural documentation included a detailed furniture plan and a set of architectural and interior design visuals presenting the proposed spaces and their design solutions.

2. The Challenge

The project contained multiple departments and space types with different functional requirements. The challenge was to organize different functions within one workplace while maintaining a logical relationship between spaces and supporting the users' operational needs.

How to create an efficient, well-organized workplace that balances management, collaboration, operations and employee wellbeing within a unified design.

Key Spaces Included

- **Executive & Management**
CEO Office, Executive Offices, Partner Office, CEO Assistant, Board Room
- **Collaboration & Training**
Meeting Rooms, Training Rooms, Interview Rooms
- **Departments & Operations**
HR, Finance, Administration, Operations Support, Facility Team, Workspace Areas
- **Technical & Support**
IT Data Center, IT Storage, IT Staging, Electricity Room, Storage
- **Employee Facilities**
Break Area, Relaxation Rooms, Prayer Rooms, Toilets

3. The Data (Information)

The furniture plan provided structured information about:

- Space types
- Department functions
- Room requirements
- Adjacencies
- Circulation areas
- Furniture arrangements
- Support and service spaces

Each room can be considered a data point with attributes such as function, department, capacity, location and relationship to other spaces.

4. Spatial Analysis

Spaces were grouped by function to understand the overall workplace structure.

5. The Furniture Plan

Spaces were grouped by function to understand the overall workplace structure.

Furniture Plan – POS Project

- Executive & Management
- Collaboration & Training
- Departments & Operations
- Technical & Support
- Employee Facilities

6. Project Visuals – Architecture + Interior Design

Lobby

Mall Corridor

Training Room

CEO Office

Workspace

Break Area

Relaxation Room

Toilets

Prayer Room

The visuals helped communicate the design concept and spatial experience to stakeholders, just like data visualizations help communicate complex information in analytics.

7. From Architecture to Data Analysis

The project demonstrated how architectural skills translate directly into data analytics thinking.

Architectural Skill	Data Analytics Equivalent
Analyzing project requirements	→ Understanding business requirements
Classifying spaces	→ Data categorization
Studying spatial relationships	→ Relationship analysis
Identifying planning constraints	→ Problem identification
Comparing design alternatives	→ Comparative analysis
Organizing complex information	→ Data organization
Presenting design solutions	→ Data visualization
Explaining design decisions	→ Data storytelling
Supporting client decisions	→ Data-driven decision support

8. The Analytical Skills

Analytical Thinking
Breaking a complex project into smaller components and understanding how they work together.

Problem Solving
Balancing different functional requirements within one environment.

Visualization
Turning complex information into visual representations.

Communication & Storytelling
Presenting information clearly to support understanding and decisions.

Attention to Detail
Working with multiple rooms, departments, facilities and technical requirements.

9. The Data Analyst Perspective

Architecture trained me to:

- 1 Collect information
- 2 Organize it
- 3 Analyze relationships
- 4 Identify constraints
- 5 Develop solutions
- 6 Visualize results
- 7 Communicate decisions

Same mindset.
Different data.

In Architecture

- Spaces
- Requirements
- Layouts
- Relationships
- Project information

In Data Analytics

- Datasets
- Variables
- Trends
- Relationships
- KPIs
- Business performance

10. Conclusion

The POS project shows the connection between my architectural background and my current career in data analysis. Architecture taught me how to work with complex information, identify relationships, solve problems, communicate visually, and make decisions based on project requirements. Data Analytics allows me to apply the same analytical mindset to business data.

My transition is not from problem-solving to data analysis — it is from analyzing physical environments and project information to analyzing business data.

DIFFERENT DATA.
SAME MINDSET.
